

Breakthroughs and Innovations

ABCOV® (New York, NY), the "World's Asbestos Solution™", provides an environmentally safe way to destroy asbestos with a non-thermal, EPA approved, chemical-physical process that: eradicates asbestos from the environment, protects the public from the devastating effects of asbestos illnesses, and provides the most cost-effective and efficient asbestos destruction process.

Asbestos and asbestos containing material are typically sent to regulated landfills creating significant liability and leading to unlimited costs for the potential responsible party. Employing the ABCOV Method eliminates current and future liability since there is no asbestos waste transportation, no asbestos waste dumping and, therefore, no asbestos liability. ABCOV eliminates landfill "cradle-to-grave" liability by terminating asbestos landfill storage, minimizing waste and end product recycling. The ABCOV Method:

- Permanently destroys all six asbestos forms in asbestos containing material
- Secondary hazardous and mixed wastes can be treated and/or stabilized after asbestos conversion
- Uses and incorporates proven, commercially available and reliable equipment
- Its built modular and transportable or fixed base
- Scalable to meet the customer's location and volume needs
